A. WRÓBLEWSKI

Institute of Experimental Physics, Warsaw University\*\*

(Received November 13, 1969)

The energy dependence of the cross sections for the inelastic  $\pi$ - $p$  collisions is compared with the predictions of the Reggeized multiperipheral model. A good agreement is observed for many reactions. The observed deviations of the experimental points from the calculated curves may be attributed to the production of resonances.

It was shown recently that the multiperipheral Regge pole exchange model describes correctly distributions of secondary particles from high energy pion-proton and  $K^-$ -proton interactions [1]. In the present paper we compare the predictions of the model for the energy dependence of cross sections for inelastic pion-proton collisions with the existing experimental data [2].

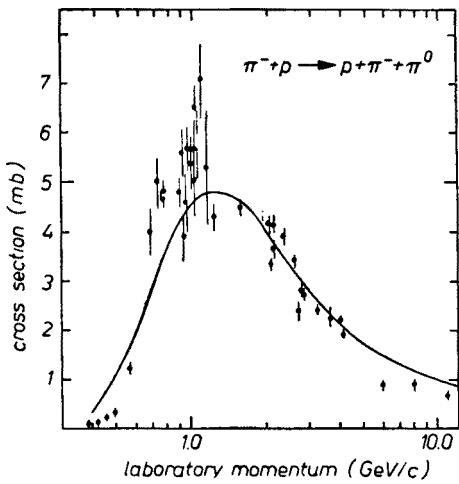

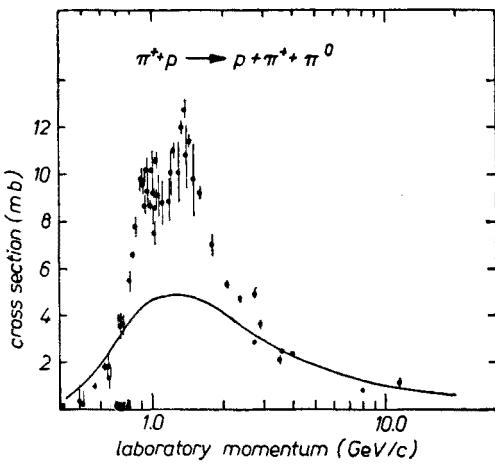

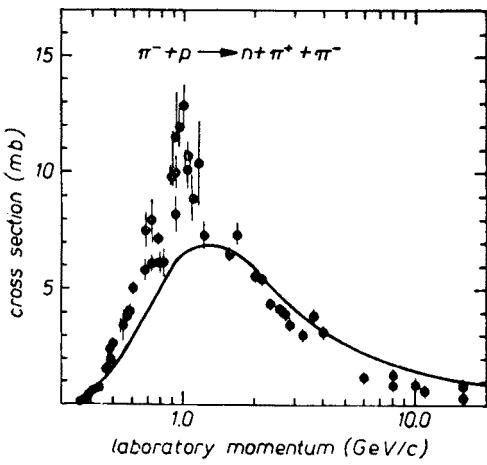

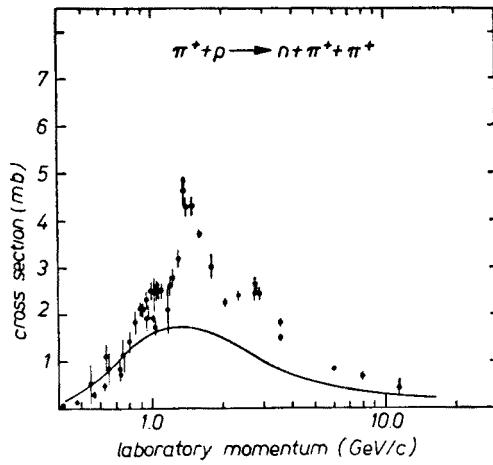

In Figs 1-6 cross sections for different pion multiplicity reactions of negative and positive pions on protons are plotted as a function of laboratory momenta of incident pions. The curves show the predictions of the discussed model. They were calculated according to the formula:

$$\sigma = \frac{A}{P^* E^*} \int |S(p_1, p_2, \dots, p_n)|^2 \delta_4 \left( P^* - \sum_{i=1}^n p_i \right) \prod_{i=1}^n \frac{d\vec{p}_i}{E_i}.$$

Here  $A$  is a normalization constant adjusted for each of the considered reactions separately,  $P^*$  is the cms momentum of colliding particles,  $E^*$  — their total energy in cms,  $p_i = (E_i, \vec{p}_i)$  is the four momentum vector of  $i$ -th secondary particle and  $P^* = (E^*, 0)$  — the four momentum vector of the system.

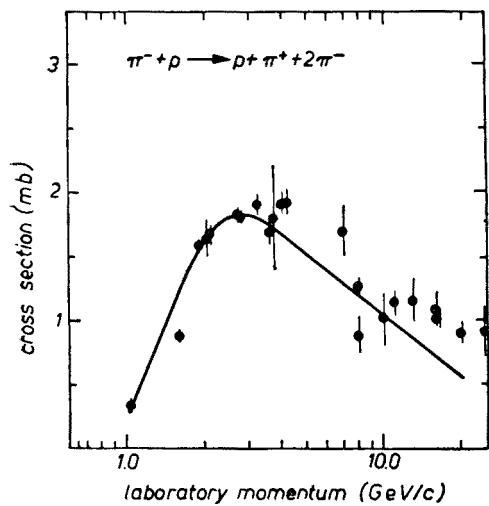

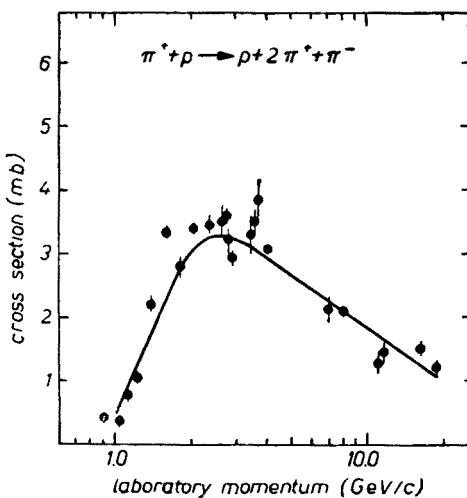

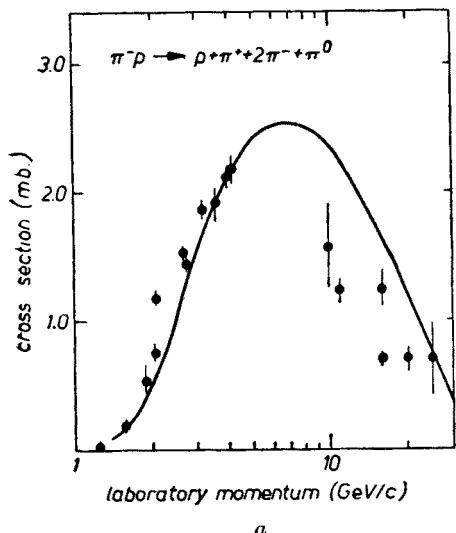

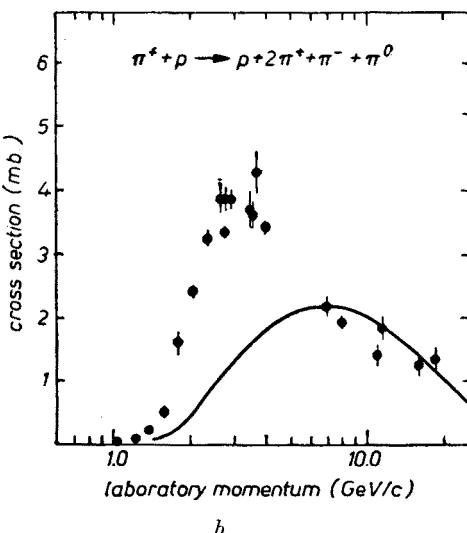

\* On leave from the Institute of Nuclear Research, Warsaw, Poland.

\*\* Address: Instytut Fizyki Eksperimentalnej, Uniwersytet Warszawski, Hoża 69, Warszawa, Polska.

*a**b*Fig. 1*a, b**a**b*Fig. 2*a, b*

The matrix element  $S(p_1, p_2 \dots, p_n)$  was taken according to the multiperipheral Regge exchange model in the form proposed by Chan Hong-Mo *et al.* [1]. The integration was performed by the Monte Carlo method using the program FOWL [3].

Comparing the obtained curves with experimental points we can notice that in spite of certain disagreements the general shape of the dependence of inelastic pion-proton cross

*a**b*Fig. 3*a, b**a*Fig. 4*a, b*

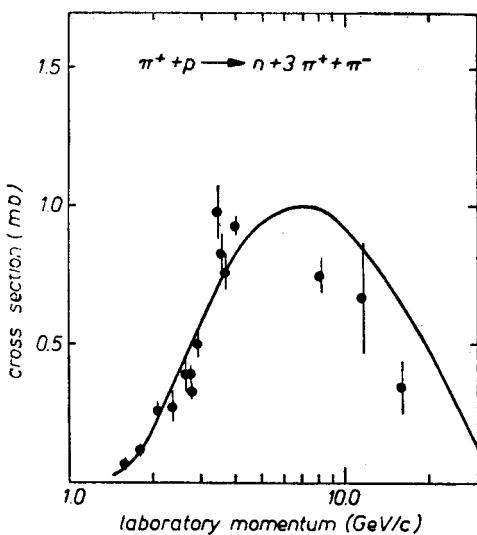

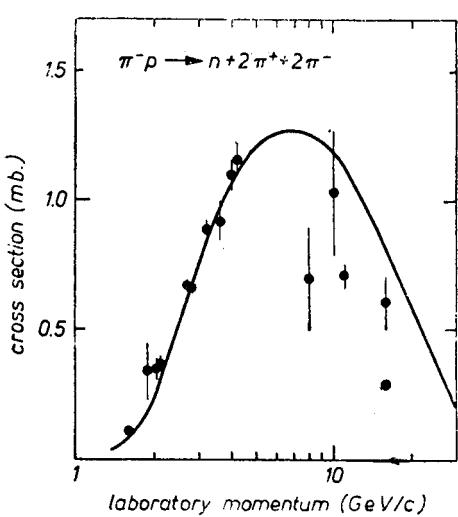

Fig. 5a, b

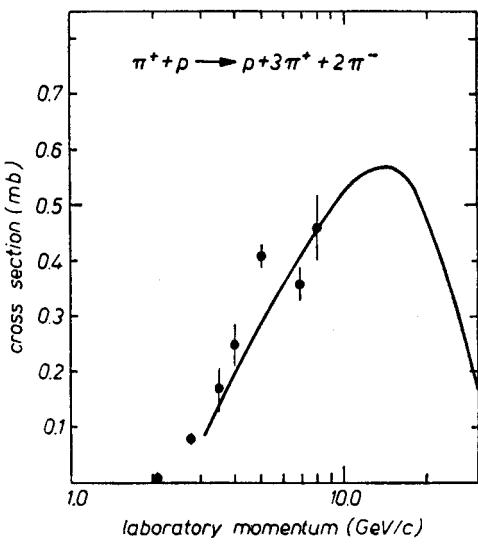

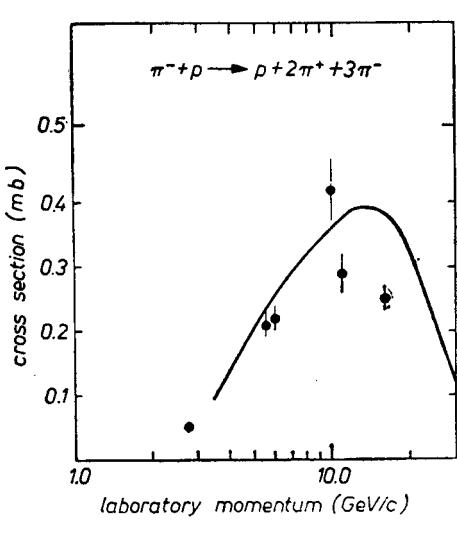

Fig. 6a, b

sections on the incident pion momentum is reproduced correctly. It should be noted that in the calculations only the normalization constants  $A$  were adjusted while all other constants entering into the matrix elements  $S$  were taken as fixed in [1] in order to describe secondary particle distributions in  $\pi$ - $p$  interactions at 8 and 16 GeV/c.

The deviations of the experimental points from the calculated curves observed for some reactions in the low momentum region can be attributed to the production of resonances. This production is especially abundant in the reaction  $\pi^+p \rightarrow p\pi^+\pi^+\pi^-\pi^0$  where strongest disagreement is observed (Fig. 4b). Also the maximum at 1 GeV/c in the measured cross sections for the reactions  $\pi^-p \rightarrow p\pi^-\pi^0$  and  $\pi^-p \rightarrow n\pi^+\pi^-$  is probably a reflection of the formation of  $I = 1/2$  isobars in the mass regions 1600–1700 MeV (Figs 1a and 2a). The formation of isobars contributes also to the cross section for the reaction  $\pi^+p \rightarrow p\pi^+\pi^0$  and  $\pi^+p \rightarrow n\pi^+\pi^+$  as has been discussed by Galloway [4].

The authors would like to thank Professor M. Danysz for his support. One of them (R. S.) wishes to thank Professor L. Leprince-Ringuet for his hospitality at Ecole Polytechnique.

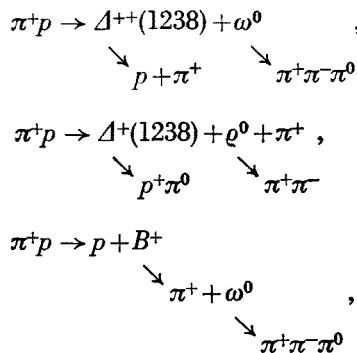

## APPENDIX

### *Compilation of inelastic $\pi^\pm$ -protons cross sections*

Values of cross sections for inelastic collisions of positive and negative pions are collected in Tables I–VIII. Each table contains data for a given reaction. By a “reaction” we understand here a process with a given configuration of a nucleon and pions in the final state not taking into account short living resonances the decay of which could lead to the state considered. For example the reaction

contains also the following processes

In the present compilation all data available to the authors by January 1969 are included.
